

**C) You have a decoy that'll turn in the wind as a motion decoy.** Vary the angle Of the tube inside the deke and you'll have feeders and watching birds and varying intensity of spin because the dekes are differently balanced...

If you have any suggestions for improvement I'll be happy to receive them.

***Disclaimer: None of the ideas described are my own. The „socked crow“ seems to become the standard in Germany because they are cheaper and MUCH more durable than the flocked ones!***

***Also the idea of building a motiondecoy - spinning on a stick - was somebody else's.***

***I was inspired by the german „Wild und Hund Forum“ and „Krähenwiki“ users.***

***Only the design of the motion decoy stick is my own, at least I Have not seen it before... All I did was add versatility, cut costs and save set up time!***
